

Native Trees of Georgia by Coder Planting Zones

by Dr. Kim D. Coder, Warnell School of Forestry & Natural Resources

Native trees represent a great ecological bounty and a rich cultural history in Georgia. Native trees live from the mountains to the sea in many diverse habitats and under many environmental constraints. Native trees add value, comfort, and beauty to life in Georgia. They have provided medicine, food, fiber, shelter, recreation and aesthetic values. Native trees witnessed the arrival of many groups of explorers and settlers, many groups of Native Americans, and a number of ice ages. Native trees are wonderfully adapted to a local area's climate, soils, pests and other plants. There is a native tree well-suited for every planting site or landscape position.

A "tree" is defined as a perennial, woody, single-stemmed plant capable of attaining a size greater than 15 feet in total height and greater than 4 inches in stem diameter. A "native" tree is generally defined as being found within the last three centuries growing wild and reproducing naturally, and not introduced to an area by human activities. A tree is considered "native in Georgia" if it was not originally brought to Georgia by people, it is found growing and reproducing naturally in the Georgia landscape, and its gene sets developed and succeeded under Georgia's environmental conditions before human dominance of the land.

Key to proper selection of a native tree for planting on any particular site is assuring it can handle various climatic and micro-site characteristics. One critical value for native trees is surviving and thriving under the normal temperature and precipitation regimes expected on a site. This attribute of surviving and thriving under normal, average temperature and precipitation conditions is summarized as Coder tree planting zones. The Coder tree planting zone map for Georgia is given in Figure 1.

Most trees can do well for many years beyond their planting zones, especially in high quality or protected areas. Young trees are much more tolerant of environmental constraints than are older trees. Coder tree planting zones help demonstrate where native trees should perform best. Beginning tree planting close to a tree's native range, as shown within the tables in this publication, will help you design and plant an effective and efficient native landscape.

Table 1 = trees growing in Coder planting zone 1 -- 112 species; Table 2 = trees growing in Coder planting zone 2 -- 113 species; Table 3 = trees growing in Coder planting zone 3 -- 102 species; Table 4 = trees growing in Coder planting zone 4 -- 105 species; Table 5 = trees growing in Coder planting zone 5 -- 123 species; Table 6 = trees growing in Coder planting zone 6 -- 139 species; Table 7 = trees growing in Coder planting zone 7 -- 116 species; Table 8 = trees growing in all Coder planting zones in Georgia -- 35 species (zones 1-7 -- a statewide planting distribution).

Figure 1: Coder Tree Planting Zones of Georgia.
(based upon normal temperature & precipitation data clustering)
